Use AutoCAD to draw 2D drawings and 3D models or to convert other formats into drawings and models. Drawings in AutoCAD can be exported to DWG, DXF, DWF, DGN, CDR, SVG, PDF and to import from DXF, DWF, CDR, SVG, DWG, DGN and PDF. Export formats are not mutually exclusive; you can export to multiple formats at the same time. Also use the Design Center to access and install additional design templates, create project drawings, and conduct work flows. The drawing and printing tools, along with several Autodesk® software products, are available online. In this article, you will learn how to draw a 2D architectural plan using AutoCAD.

With a start-up firm in the US facing a lawsuit in which a court has ruled the patent they have used to sue Google is invalid, an interesting question is being raised: What are the consequences of this decision? The most striking difference is that in the US the courts have a track record of a wide range of companies getting into dispute with each other for minor infringements, and a court somewhere (not necessarily the one where the original patent was issued) ultimately settles it, with the US Patent and Trademark Office usually coming to some sort of an agreement that the patent is being held up by somebody, and they either have to go to court or give a monetary settlement. In the case of Google vs Motorola, the US Supreme Court came to the conclusion that the patent was invalid, and it will have to be re-examined in the US courts. In the other parts of the world, however, there is no such guarantee. Companies can keep suing each other, and making noise, until they either get an end to the noise or hit a company that can pay off the legal bills that such lawsuits have. In the case of Google vs Motorola, which is the subject of a lawsuit in Germany, the European Patent Office has declared the patent in question is invalid. The court has come to this decision not through a kind of a beauty contest between the two companies, or an expensive trial, but because it couldn't conclude that the patent was valid. The difference is that in the US, the court that has been hearing the case has come to a decision that it is invalid, but for the rest of the world, it's up to the parties to come to an agreement about the validity of the patent. It could be that the two parties will not come to an agreement, and there will be a messy trial. The second difference is that while there may be an end to the dispute in the US, in the rest of the world there is no such guarantee. The company that owns the patent can still sue, and Google can still defend itself by showing that the patent is not valid. The third difference is that in the US, companies can keep the money they get from lawsuits, and keep it as profit. In the rest of the world, companies are not allowed to keep this money, and must spend it back on new products. The end result is that a company that gets money from a lawsuit can pay off the legal costs by making the products that they have
