Microsoft Windows applications: AutoCAD 2010, AutoCAD LT 2010, and AutoCAD Architecture 2010 were available on Windows OS only, while AutoCAD Architecture 2012 was available on Windows and Linux operating systems. AutoCAD LT has been discontinued. AutoCAD Architecture for Windows OS was previously bundled with AutoCAD LT, but was released on the Autodesk Exchange Apps store separately from AutoCAD LT in June 2014. Design-time application Autodesk Inventor (2009–2010), a computer-aided drafting (CAD) application for creating and modifying 2D technical drawings. It was available for Windows only, with later versions available for OS X and Linux, and is now part of AutoCAD Architecture 2012. There is also a free version of the application, called Inventor Essentials, which does not include all the features. Design-time and production-time functionality is still delivered by Autodesk's native application, AutoCAD. Autodesk Navisworks (2010–2011), a CAD/CAM application, which was bundled with AutoCAD LT 2010 and Autodesk Inventor. Business Catalyst Business Catalyst is a web-based application for the online marketing and business development of small and medium businesses. It integrates marketing, communication, social media, and accounting. The company behind it, Silicon Valley Software, was acquired by Autodesk in 2009, and is now part of Autodesk's Marketing Solution group, along with Inventor and CAD products. Advanced technology products AutoCAD Architecture AutoCAD Architecture (2001–2012) is a fully featured, multi-platform, 3D CAD product, including architectural design and animation. It can be used as a standalone application or as an add-on to AutoCAD, AutoCAD LT, and Revit. It runs on Windows, Linux, and Mac platforms, and is bundled with AutoCAD LT and AutoCAD Architecture. Revit Revit is a cross-platform 3D design and architecture software product. The product was developed by MicroStation creator Microstation Corp. and was acquired by Autodesk in 2003. Revit is currently available as a separate program, or as a subscription service that combines Revit with other Autodesk products. A wide variety of packages exist for the packaging of fresh produce. Due to the large weight and size of the produce, the packaging is typically heavy and bulky. This bulkiness and weight make it cumbersome to transport and store the packages. A common method for transporting and storing fresh produce is to fill a standard plastic grocery bag with the produce and then secure the bag with an elastic tie. The produce is typically placed in a recess formed in a vertical wall of the bag, leaving the upper portion of the produce exposed. The produce typically remains in the standard grocery bag for one week or more. The use of a standard grocery bag has several shortcomings. The elastic tie is typically designed for the retail grocery environment. In the fresh produce environment, the elastic tie is often not strong enough for the load and therefore tears or otherwise fails. The elastic tie is also typically designed to be applied around the produce. This means that the elastic tie is tied around the produce, which can cause bruising of the produce. Further, the elastic tie is difficult to remove from the bag after the produce is removed. In addition, standard grocery bags are not designed to protect the produce from contamination from the ambient environment. In particular, ambient air can often find its way into the bag and come into contact with the produce. Contamination of the produce can occur in a number of ways. For example, the ambient air can enter the bag when the elastic tie is not properly tied, allowing air to enter the bag. The ambient air can also enter the bag when the bag is being handled by the consumer, when the bag is opened by the consumer, when the bag is opened during transit by the delivery person, or when the bag is opened during storage by the consumer. In addition, standard grocery bags are typically not designed to protect the produce from temperature fluctuations. In particular, produce is typically
