===== This is a test of all that I have written.

===== Note on the Taxi MDT Decoder History ===== I have since released a public version of my decoder. This is a regular release, very similar to other software. This means that it is a stable release, doesn't have major bugs and is quite stable. The intent of this program is to help promote the usage of the Taxi MDT in the United States and Canada. The way I feel it can be used is very close to how we use the ATSC Airband P2P system in Japan. The big difference is that my decoder is intended to be ran from a personal computer and is not intended to be run in a proprietary environment. I feel that the best way to run it from a PC is as a driver for an Ethernet cable. The link will be set up and then it will behave like a radio. Since the PC and radio will not do anything else they will sit in the background as they are there. While this is somewhat inconvenient it can be used and does achieve what I was intending. So to all the other computers that are on the same network as the PC, you will not need to do anything to make your system able to act as a radio. I have made an installer available so that you can install the software on your PC.

Taxi MDT Decoder [Updated]

Taxi MDT Decoder decodes 100 bps of the taxi data. However, the decoder is currently set up to decode MPT1327 data and may not decode other types of data sent in similar patterns. Its purpose is to enable the programmer to decode the data sent by the taxi and the dispatcher and can help determine what the data fields mean. This decoder uses the Wireshark TCP/IP networking suite. Taxi MDT Decoder Features: Decodes MPT1327 signal tone and message data. Prints message IDs, date, time, and message. Outputs the decoded data in a standard format. Built in Logger records the decoded data into a log. Taxi MDT Decoder Examples: Use the following examples to decode the data coming from the taxi and the dispatcher. Run the Taxi MDT Decoder Usage: taxi-mdt-decoder [options] Options: -v Verbose --help Print usage information Requires Wireshark Create a Log to Record Decoded Data Usage: taxi-mdt-decoder-log [options] Options: -v Verbose --help Print usage information Requires Wireshark Example: taxi-mdt-decoder-log -v Example: taxi-mdt-decoder-log --help Example: taxi-mdt-decoder-log -v -v -v --help Output: ./taxi-mdt-decoder.bin Usage: taxi-mdt-decoder [options] Options: -v Verbose --help Print usage information Requires Wireshark Running the Logger ./taxi-mdt-decoder-log.bin -v -v -v --help Log output: ./taxi-mdt-dec 77a5ca646e

Taxi MDT Decoder With License Key PC/Windows

Taxi MDT Decoder is a Java class file. License: Taxi MDT Decoder is free to use in it's current version under the terms of the GNU General Public License. Website: Email: eng@edmundseifried.de Author: Edmund Seifried For more information see: Version History: 1.0.2: Added support for using the taxi service data directly instead of using the Taxi-MCT service data. Usage: The source code for the application is the readme.txt file. After unpacking the taxi-mdt-decoder.zip file you will find a directory called mdt-decoder. To use the decoder create a java project that extends the TaxiMDTDecoder class and use the readme.txt file to get an idea of how to get things done. What's New In Taxi MDT Decoder?

Note: In the decoder, tones are represented by a three digit number (e.g. 382) and the tone frequency is represented by a number (e.g. 3960 Hz)
Note: The first digit is always an even number (e.g. 3) Note: For MPT1327, the first digit (i.e. 2) represents the start tone and the second digit (i.e. 8) represents the end tone. Note: The first six digits of the tone number always represent the start tone. If the first digit (i.e. 2) is not 2, then the value from the second digit (i.e. 8) will be used to represent the tone. Note: For MPT1327, the first and the last digits always represent the start tone and the end tone. If the last digit (i.e. 4) is not 4, then the value from the first digit (i.e. 2) will be used to represent the end tone. Taxi MDT Decoder Features: Three modes are available for taxi decoders: Decode all modes Decode only the last tone Decode only the first tone If the decode all is selected, the decoder will attempt to decode all different modes available If the last tone is selected, the decoder will decode only the last mode available If the first tone is selected, the decoder will decode only the first mode available The decoder displays the start tone, end tone, start frequency and end frequency values. The decoder also displays information about the decoding of the tones: For MPT1327: In the driver cab section, the following information is displayed: Indicates that the mode is a tone: If no value is displayed, the mode is an audio If mode is read, the mode is a tone If the tone starts at 0, the tone is silent If the tone is read, the frequency of the tone is displayed If the tone ends at 0, the tone is silent If the tone does not end at 0, the frequency of the tone is displayed Notes: If the tone starts at 0, then the frequency should be added to the previous frequency (i.e. A three digit number is displayed, so the first digit of the three digit number is the frequency and the third digit of the three digit number is the frequency added to the previous frequency) If the tone does not end at 0, then the value of the last digit of the three digit number should be added to the previous frequency For MPT1327: For the dispatcher cab section: The number of tones decoded is shown If no value is displayed, the value
