In an attempt to provide a cost effective solution for an end-user, to streamline the management of document and image data, the on-line searchable indexing of documents and images and their storage and retrieval, document authoring, and image retrieval, there has been developed by the assignee of this application, the On-Line Information Retrieval System ("ORIS"). ORIS is a software product that is capable of generating on-line information searchable indexes for documents and images, including the ability to search the index, retrieve documents containing selected text, extract, display, and store the text and images from the retrieved documents. In addition, ORIS is also capable of recording a document containing selected text into a form that is suitable for direct input into another application program. Although a product such as ORIS, which is capable of searching and retrieving information from a document or image, can greatly increase the speed of searching through large document or image databases, ORIS does not have the ability to display, manipulate, or store the information in such a way as to be accessible to the end-user. The applicant of the instant application has developed an image processing application, marketed under the trademark CARTESIAN, that is capable of browsing through large image databases and placing the information of the database in a form that can be easily manipulated and stored by the end-user. As is known, CARTESIAN is an application program that permits an end-user to place, resize, and rotate images into a "CARTESIAN" file, which is a separate file that can then be stored and retrieved using ORIS. In addition, CARTESIAN is capable of converting a "CARTESIAN" file to a single page, or document, that can then be saved to disk in a form that is suitable for entering directly into a word processor or a spreadsheet program.
